NEW QUESTION: 1

Pause the rollout of the deployment

Answer:

kubectl rollout pause deploy webapp

NEW QUESTION: 2

Create a Pod nginx and specify both CPU, memory requests and limits together and verify.

A. kubectl run nginx-request --image=nginx --restart=Always --dryrun -o yaml > nginx-request.yml

// add the resources section and create

apiVersion: v1

kind: Pod

metadata:

labels:

run: nginx

name: nginx

resources:

requests:

memory: "100Mi"

cpu: "0.4"

limits:

memory: "200Mi"

cpu: "7"

restartPolicy: Always

k kubectl apply -f nginx-request.yml

// Verify

Kubectl top po

B. kubectl run nginx-request --image=nginx --restart=Always --dryrun -o yaml > nginx-request.yml

```
// add the resources section and create
apiVersion: v1
kind: Pod
metadata:
labels:
run: nginx
name: nginx-request
spec:
containers:
- image: nginx
name: nginx
resources:
requests:
memory: "100Mi"
cpu: "0.5"
limits:
memory: "200Mi"
cpu: "1"
restartPolicy: Always
k kubectl apply -f nginx-request.yaml
// Verify
Kubectl top po
```

Answer: B ([LEAVE A REPLY](#))

NEW QUESTION: 3

Score: 4%

Task

Create a persistent volume with name app-data , of capacity 1Gi and access mode ReadOnlyMany. The type of volume is hostPath and its location is /srv/app-data .

Answer:

See the solution below.

Explanation

Solution:

```
#vi pv.yaml
apiVersion: v1
kind: PersistentVolume
metadata:
name: app-config
spec:
capacity:
storage: 1Gi
accessModes:
- ReadOnlyMany
hostPath:
path: /srv/app-config
#
kubectl create -f pv.yaml
```

NEW QUESTION: 4

Change the Image version back to 1.17.1 for the pod you just updated and observe the changes

Answer:

kubectl set image pod/nginx nginx=nginx:1.17.1 kubectl describe po nginx kubectl get po nginx -w # watch it

NEW QUESTION: 5

Create a deployment spec file that will:

- * Launch 7 replicas of the nginx Image with the labelapp_runtime_stage=dev
- * deployment name: kual00201

Save a copy of this spec file to /opt/KUAL00201/spec_deployment.yaml
(or /opt/KUAL00201/spec_deployment.json).

When you are done, clean up (delete) any new Kubernetes API object that you produced during this task.

Answer:

See the solution below.

Explanation

solution

```
root@node-1:~# k create deploy kual00201 --image=nginx --dry-run=client -o yaml > /opt/KUAL00201/spec_deployment.yaml
root@node-1:~# vim /opt/KUAL00201/spec_deployment.yaml
```

freeqas.com

Readme Web Terminal THE LINUX FOUNDATION

```
apiVersion: apps/v1

█
```

NEW QUESTION: 8

Configure the kubelet systemd- managed service, on the node labelled with name=wk8s-node-1, to launch a pod containing a single container of Image httpd named webtool automatically. Any spec files required should be placed in the /etc/kubernetes/manifests directory on the node.

You can ssh to the appropriate node using:

```
[student@node-1] $ ssh wk8s-node-1
```

You can assume elevated privileges on the node with the following command:

```
[student@wk8s-node-1] $ | sudo -i
```

Answer:

solution

```
root@node-1:~#  
root@node-1:~# kubectl config use-context wk8s  
Switched to context "wk8s".  
root@node-1:~# ssh wk8s-node-1

NEW QUESTION: 10

List all the pods showing name and namespace with a json path expression

Answer:

```
kubectl get pods -o=jsonpath="{.items[*]['metadata.name',  
'metadata.namespace']}"
```

NEW QUESTION: 11

Create a pod with environment variables as var1=value1. Check the environment variable in pod

Answer:

```
kubectl run nginx --image=nginx --restart=Never --env=var1=value1
```

then

```
kubectl exec -it nginx -- env
```

or

```
kubectl exec -it nginx -- sh -c 'echo $var1'
```

or

```
kubectl describe po nginx | grep value1
```

NEW QUESTION: 12

Create a Kubernetes secret as follows:

Name: super-secret

password: bob

Create a pod named pod-secrets-via-file, using the redis Image, which mounts a secret named super-secret at /secrets.

Create a second pod named pod-secrets-via-env, using the redis Image, which exports password as CONFIDENTIAL

Answer:

solution

```
root@node-1:~#  
root@node-1:~# k create secret generic super-secret --from-literal=password=bob  
secret/super-secret created  
root@node-1:~# vim secret.yaml
```

NEW QUESTION: 13

An Administrator is configuring Authentication Enforcement and they would like to create an exemption rule to exempt a specific group from authentication. Which authentication enforcement object should they select?

- A. default-web-form
- B. default-browser-challenge
- C. default-no-captive-port
- D. default-authentication-bypass

Answer: C ([LEAVE A REPLY](#))

NEW QUESTION: 14

Print pod name and start time to "/opt/pod-status" file

Answer:

kubect1 get pods -o=jsonpath='{range .items[*]}{.metadata.name}{"\t"}{.status.podIP}{"\n"}{end}'

NEW QUESTION: 15

Get list of persistent volumes and persistent volume claim in the cluster

Answer:

kubectl get pv kubectl get pvc

NEW QUESTION: 16

Delete the pod without any delay (force delete)

Answer:

Kubect1 delete po "POD-NAME" --grace-period=0 --force

NEW QUESTION: 17

What are the differences between using a service versus using an application for Security Policy match?

- A.** Use of a "service" enables the firewall to take immediate action with the first observed packet based on port numbers. Use of an application allows the firewall to take action after enough packets allow for App-ID identification regardless of the ports being used
- B.** Use of a "service" enables the firewall to take immediate action with the first observed packet based on port numbers. Use of an "application allows the firewall to take immediate action if the port being used is a member of the application standard port list
- C.** Use of a "service" enables the firewall to take action after enough packets allow for App-ID identification
- D.** There are no differences between "service" or "application." Use of an "application simplifies configuration by allowing use of a friendly application name instead of port numbers.

NEW QUESTION: 19

Check logs of each container that "busyboxpod-{1,2,3}"

A. kubectl logs busybox -c busybox-container-1

kubectl logs busybox -c busybox-container-3

kubectl logs busybox -c busybox-container-3

B. kubectl logs busybox -c busybox-container-1

kubectl logs busybox -c busybox-container-2

kubectl logs busybox -c busybox-container-3

Answer: B ([LEAVE A REPLY](#))

NEW QUESTION: 20

A Kubernetes worker node, named wk8s-node-0 is in state NotReady. Investigate why this is the case, and perform any appropriate steps to bring the node to a state, ensuring that any changes are made permanent.

You can ssh to the failed node using:

[student@node-1] \$ | ssh Wk8s-node-0

You can assume elevated privileges on the node with the following command:

[student@wk8s-node-0] \$ | sudo -i

Answer:

See the solution below.

Explanation

solution

F:\Work\Data Entry Work\Data Entry\20200827\CKA\20 C.JPG

The screenshot shows a web terminal window with a dark blue header. On the left, there are two tabs: 'Readme' and 'Web Terminal'. On the right, the 'THE LINUX FOUNDATION' logo is displayed. The terminal content shows a user at 'root@node-1' running 'kubectl config use-context wk8s', which switches the context to 'wk8s'. Then, the user runs 'k get nodes', displaying a table of node information. The table has columns for NAME, STATUS, ROLES, AGE, and VERSION. It lists three nodes: 'wk8s-master-0' (Ready, master role, 77d old, v1.18.2), 'wk8s-node-0' (NotReady, no role, 77d old, v1.18.2), and 'wk8s-node-1' (Ready, no role, 77d old, v1.18.2). Finally, the user enters 'ssh wk8s-node-0', and a cursor is visible on the next line. A large, semi-transparent watermark 'freeqas.com' is overlaid diagonally across the terminal output.

```
root@node-1:~# kubectl config use-context wk8s
Switched to context "wk8s".
root@node-1:~# k get nodes
NAME             STATUS    ROLES    AGE   VERSION
wk8s-master-0    Ready     master   77d   v1.18.2
wk8s-node-0      NotReady  <none>    77d   v1.18.2
wk8s-node-1      Ready     <none>    77d   v1.18.2
root@node-1:~# ssh wk8s-node-0
█

k8s-node-1	Ready	<none>	77d	v1.18.2

```
root@node-1:~# vim /opt/KUCC00104/kucc00104.txt
```

NEW QUESTION: 22

Fix a node that shows as non-ready

A. Kubectl get nodes

// Check which node shows as not ready

kubectl describe nodes "node-name"

// Login to the node which shows as not ready and check the process for kubelet, docker, kube-proxy.

// systemctl status kubelet (or) ps -aux | grep -i "processname"

// If the process is not started, then start using

systemctl start kubelet / docker

// Verify

ps -auxww | grep -i "process-name"

kubectl get nodes

B. Kubectl get nodes

```
// Check which node shows a not ready
kubectl describe nodes "node-name"
// Login to the node which shows as not ready and check the
systemctl start kubelet / docker
// Verify
ps -auxww | grep -i "process-name"
kubectl get nodes
```

Answer: A ([LEAVE A REPLY](#))

NEW QUESTION: 23

Create a deployment as follows:

- * Name:nginx-random
- * Exposed via a servicenginx-random
- * Ensure that the service & podare accessible via theirrespective DNS records
- * The container(s) within anypod(s) running as a part of thisdeployment should use theenginxImage Next, use the utilitynslookupto lookup the DNS records of the service &pod and write the output to /opt/KUNW00601/service.dnsand/opt/KUNW00601/pod.dnsrespectively.

Answer:

See the solution below.

Explanation

Solution:

```
root@node-1:~#  
root@node-1:~# k create deploy nginx-random --image=nginx  
deployment.apps/nginx-random created  
root@node-1:~# k expose deploy nginx-random --name=nginx-random --port=80 --target-port=80  
service/nginx-random exposed  
root@node-1:~# vim dns.yaml
```

freeqas.com

Delete the above pod and create again from the same yaml file
and verifies there is no "test-file.txt" in the path /data/redis
(Since non-persistent storage "emptyDir" is used).

Answer:

```
kubectrl delete pod test-redis kubectrl create -f test-redis.yaml kubectrl exec -it test-redis /bin/sh cat /data/redis/file.txt // file doesn't exist
```

NEW QUESTION: 25

Create an nginx pod which loads the secret as environment variables

A. // create a yaml file

```
kubectrl run nginx --image=nginx --restart=Never --dry-run -o
```

```
yaml > nginx.yaml
```

// add env section below and create

```
vim nginx.yaml
```

```
apiVersion: v1
```

```
kind: Pod
```

```
metadata:
```

```
labels:
```

```
run: nginx
```

```
name: nginx
```

```
spec:
```

```
containers:
```

```
- image: nginx
```

```
name: nginx
```

```
envFrom:
```

```
- secretRef:
```

```
name: my-secret
```

```
restartPolicy: Never
```

```
kubectrl apply -f nginx.yaml
```

//verify

```
kubectrl exec -it nginx - env
```

B. // create a yaml file

```
kubectrl run nginx --image=nginx --restart=Never --dry-run -o
```

```
yaml > nginx.yaml
```

// add env section below and create

```
vim nginx.yaml
```

```
run: nginx
```

```
name: nginx
```

```
spec:
```

```
containers:
```

```
- image: nginx
```

```
name: nginx
```

```
envFrom:
- secretRef:
name: my-secret
restartPolicy: Never
kubectl apply -f nginx.yaml
//verify
kubectl exec -it nginx - env
```

Answer: A ([LEAVE A REPLY](#))

NEW QUESTION: 26

Create a busybox pod which executes this command sleep 3600 with the service account admin and verify

A. kubectl run busybox --image=busybox --restart=Always --dry-run

-o yaml -- /bin/sh -c "sleep 3600" > busybox.yml

// Edit busybox.yaml file

apiVersion: v1

kind: Pod

metadata:

creationTimestamp: null

labels:

run: busybox

name: busybox

spec:

serviceName: admin

containers:

- args:

- /bin/sh

- -c

- sleep 3600

image: busybox

name: busybox

restartPolicy: Always

// verify

K kubectl describe po busybox

B. kubectl run busybox --image=busybox --restart=Always --dry-run

-o yaml -- /bin/sh -c "sleep 3600" > busybox.yml

// Edit busybox.yaml file

apiVersion: v1

kind: Pod

metadata:

creationTimestamp: null

labels:

```
run: busybox
name: busybox
spec:
  serviceAccountName: admin
  containers:
  - args:
    - /bin/sh
    - -c
    - sleep 3800
  image: busybox
  name: busybox
  restartPolicy: Always
// verify
K kubectl describe po busybox
```

Answer: A ([LEAVE A REPLY](#))

NEW QUESTION: 27

Monitor the logs of pod foo and:

- * Extract log lines corresponding unable-to-access-website
- * Write them to/opt/KULM00201/foo

Answer:

See the solution below.

Explanation

solution

> Web Terminal

THE LINUX FOUNDATION

LINUX
FOUNDATION

```
student@node-1:~$  
student@node-1:~$ sudo -i  
root@node-1:~# alias k=kubectl  
root@node-1:~#
```

freeqas.com

The screenshot shows a terminal window with a blue header bar containing 'Readme' and 'Web Termina' buttons, and 'THE LINUX FOUNDATION' logo. The terminal text is as follows:

```
root@node-1:~# k logs foo | grep unable-to-access-website
Thu Aug 27 05:25:28 UTC 2020 - ERROR - unable-to-access-website
root@node-1:~# k logs foo | grep unable-to-access-website > /opt/k8s00201/foo
root@node-1:~#
```

A large diagonal watermark 'freeqas.com' is visible across the terminal output.

NEW QUESTION: 28

What file type upload is supported as part of the basic WildFire service?

- A. ELF
- B. PE
- C. BAT
- D. VBS

Answer: ([SHOW ANSWER](#))

NEW QUESTION: 29

Check the image version in pod without the describe command

Answer:

See the solution below.

Explanation

```
kubectl get po nginx -o
```

```
jsonpath='{.spec.containers[].image}{"\n"}'
```

NEW QUESTION: 30

Create 2 nginx image pods in which one of them is labelled with env=prod and another one labelled with env=dev and verify the same.

A. `kubectrl run --generator=run-pod/v1 --image=nginx -- labels=env=prod nginx-prod --dry-run -o yaml > nginx-prodpod.yaml` Now, edit nginx-prod-pod.yaml file and remove entries like "creationTimestamp: null" "dnsPolicy: ClusterFirst" `vim nginx-prod-pod.yaml` `apiVersion: v1 kind:`

Pod metadata:

labels:

env: prod

name: nginx-prod

spec:

containers:

- image: nginx

name: nginx-prod

restartPolicy: Always

`kubectrl create -f nginx-prod-pod.yaml`

`kubectrl run --generator=run-pod/v1 --image=nginx --`

`labels=env=dev nginx-dev --dry-run -o yaml > nginx-dev-pod.yaml`

`apiVersion: v1`

`kind: Pod`

metadata:

- image: nginx

name: nginx-dev

restartPolicy: Always

`kubectrl create -f nginx-prod-dev.yaml`

Verify :

`kubectrl get po --show-labels`

`kubectrl get po -l env=dev`

B. `kubectrl run --generator=run-pod/v1 --image=nginx -- labels=env=prod nginx-prod --dry-run -o yaml > nginx-prodpod.yaml` Now, edit nginx-prod-pod.yaml file and remove entries like "creationTimestamp: null" "dnsPolicy: ClusterFirst" `vim nginx-prod-pod.yaml` `apiVersion: v1 kind:`

Pod metadata:

labels:

env: prod

name: nginx-prod

spec:

containers:

- image: nginx

name: nginx-prod

restartPolicy: Always

`kubectrl create -f nginx-prod-pod.yaml`

`kubectrl run --generator=run-pod/v1 --image=nginx --`

`labels=env=dev nginx-dev --dry-run -o yaml > nginx-dev-pod.yaml`

`apiVersion: v1`

`kind: Pod`

metadata:

labels:

env: dev

name: nginx-dev

spec:

containers:

- image: nginx

name: nginx-dev

restartPolicy: Always

kubectl create -f nginx-prod-dev.yaml

Verify :

kubectl get po --show-labels

kubectl get po -l env=prod

kubectl get po -l env=dev

Answer: ([SHOW ANSWER](#))

NEW QUESTION: 31

Scale the deployment to 5 replicas

Answer:

To protect your firewall and network from single source denial of service (DoS) attacks that can overwhelm its packet buffer and cause legitimate traffic to drop, you can configure:

- A. BGP (Border Gateway Protocol)
- B. PGP (Packet Gateway Protocol)
- C. PBP (Protocol Based Protection)
- D. PBP (Packet Buffer Protection)

Answer: ([SHOW ANSWER](#))

NEW QUESTION: 35

A bootstrap USB flash drive has been prepared using a Linux workstation to load the initial configuration of a Palo Alto Networks firewall. The USB flash drive was formatted using file system ntfs and the initial configuration is stored in a file named init-cfg.txt.

The contents of Init-cfg.txt in the USB flash drive are as follows:

```
type=static
ip-address=10.5.107.19
default-gateway=10.5.107.1
netmask=255.255.255.0
ipv6-address=2001:400:100::1/64
ipv6-default-gateway=2001:400:100::2
hostname=Ca-FW-DC1
panorama-server=10.5.107.20
panorama-server-2=10.5.107.21
tplname=FINANCE TG4
dname=finance_dg
dns-primary=10.5.6.6
op-command-modes multi-vsyes.jumbo-frame
dhcp-send-hostname=no
dhcp-send-client-id=no
dhcp-accept-server-hostname=no
dhcp-accept-server-domain=no
```

The USB flash drive has been inserted in the firewalls' USB port, and the firewall has been powered on. Upon boot, the firewall fails to begin the bootstrapping process. The failure is caused because:

- A. nit-cfg bit is an incorrect filename the correct filename should be init-ofg.xml
- B. The USB drive has been formatted with an unsupported file system
- C. The USB must be formatted using the ext4 file system
- D. The bootstrap.xml file is a required file, but it is missing
- E. There must be commas between the parameter names and their values instead of the equal symbols

Answer: C ([LEAVE A REPLY](#))

NEW QUESTION: 36

Create an nginx pod with containerPort 80 and with a PersistentVolumeClaim "task-pv-claim" and has a mount path "/usr/share/nginx/html"

- A. vim nginx-pvc-pod.yaml

```
apiVersion: v1
kind: Pod

NEW QUESTION: 37

Create an nginx pod and list the pod with different levels of verbosity

Answer:

See the solution below.

Explanation

```
// create a pod
kubectl run nginx --image=nginx --restart=Never --port=80
// List the pod with different verbosity
kubectl get po nginx --v=7
kubectl get po nginx --v=8
kubectl get po nginx --v=9
```

NEW QUESTION: 38

A Kubernetes worker node, named `node-0`. Investigate why this is the case, and perform any appropriate steps to bring the node to a state, ensuring that any changes are made permanent.

You can `ssh` to the failed node using:

```
[student@node-1] $ | ssh wk8s-node-0
```

You can assume elevated privileges on the node with the following command:

```
[student@wk8s-node-0] $ | sudo -i
```

Answer:

See the solution below.

Explanation

solution

```
root@node-1:~# kubectl config use-context wk8s
Switched to context "wk8s".
root@node-1:~# k get nodes
NAME           STATUS    ROLES    AGE   VERSION
wk8s-master-0  Ready     master   77d   v1.18.2

NEW QUESTION: 39

Create a pod with image nginx called nginx and allow traffic on port 80

Answer:

```
kubectl run nginx --image=nginx --restart=Never --port=80
```

NEW QUESTION: 40

Create the nginx pod with version 1.17.4 and expose it on port 80

Answer:

```
kubectl run nginx --image=nginx:1.17.4 --restart=Never -- port=80
```

NEW QUESTION: 41

A bootstrap USB flash drive has been prepared using a Windows workstation to load the initial configuration of a Palo Alto Networks firewall that was previously being used in a lab. The USB flash drive was formatted using file system FAT32 and the initial configuration is stored in a file named init-cfg.txt. The firewall is currently running PAN-OS 10.0 and using a lab config. The contents of init-cfg.txt in the USB flash drive are as follows:

```
type=dhcp-client
ip-address=
default-gateway=
netmask=
```

ipv6-address=
ipv6-default-gateway=
hostname=Ca-FW-DC1
panorama-server=10.5.107.20
panorama-server-2=10.5.107.21
tplname=FINANCE_TG4
dgname=finance_dg
dns-primary=10.5.6.6
dns-secondary=10.5.6.7
op-command-modes-multi-vsyst.jumbo-frame
dhcp-send-hostname=yes
dhcp-send-client-id=yes
dhcp-accept-server-hostname=yes
dhcp-accept-server-domain=yes

The USB flash drive has been inserted in the firewalls' USB port, and the firewall has been restarted using command> request restart system

Upon restart, the firewall fails to begin the bootstrapping process. The failure is caused because:

- A. The USB must be formatted using the exi3 file system, FAT32 is
- B. The hostname is a required parameter, but it is missing in init-cfg.txt
- C. PAN-OS version must be 9.1 x at a minimum, but the firewall is running 10.0x
- D. Firewall must be in factory default state or have all private data deleted for bootstrapping
- E. The bootstrap xml file is a required file, but it is missing

NEW QUESTION: 47

Create a file:

/opt/KUCC00302/kucc00302.txt that lists all pods that implement service in namespace development.

The format of the file should be one pod name per line.

Answer:

See the solution below.

Explanation

solution

```
root@node-1:~#
root@node-1:~# k describe svc baz -n development
Name:          baz
Namespace:     development
Labels:        <none>
Annotations:   <none>
Selector:      name=foo
Type:          ClusterIP
IP:            10.104.252.175
Port:          <unset> 80/TCP

NEW QUESTION: 48

List all the pods sorted by name

Answer:

kubectl get pods --sort-by=.metadata.name

NEW QUESTION: 49

Create a nginx pod with label env=test in engineering namespace

Answer:

See the solution below.

Explanation

kubectl run nginx --image=nginx --restart=Never --labels=env=test --namespace=engineering --dry-run -o yaml > nginx-pod.yaml kubectl run nginx --image=nginx --restart=Never --labels=env=test --namespace=engineering --dry-run -o yaml | kubectl create -n engineering -f -

YAML File:

apiVersion: v1

kind: Pod

metadata:

name: nginx

```
namespace: engineering
labels:
env: test
spec:
containers:
- name: nginx
image: nginx
imagePullPolicy: IfNotPresent
restartPolicy: Never
kubectl create -f nginx-pod.yaml
```

NEW QUESTION: 50

List all the pods showing name and namespace with a json path expression

Answer:

```
kubectl get pods -o=jsonpath="{.items[*]['metadata.name', 'metadata.namespace']}"
```

NEW QUESTION: 51

Given a partially-functioning Kubernetes cluster, identify symptoms of failure on the cluster.

Determine the node, the failing service, and take actions to bring up the failed service and restore the health of the cluster. Ensure that any changes are made permanently.

You can ssh to the relevant nodes (bk8s-master-0 or bk8s-node-0) using:

```
[student@node-1] $ ssh <nodename>
```

You can assume elevated privileges on any node in the cluster with the following command:

```
[student@nodename] $ | sudo -i
```

Answer:

solution

```
root@node-1:~#  
root@node-1:~# kubectl config use-context bk8s  
Switched to context "bk8s".  
root@node-1:~# ssh bk8s-master-0

NEW QUESTION: 57

Create a deployment as follows:

- * Name: nginx-app
- * Using container nginx with version 1.11.10-alpine
- * The deployment should contain 3 replicas

Next, deploy the application with new version 1.11.13-alpine, by performing a rolling update.

Finally, rollback that update to the previous version 1.11.10-alpine.

Answer:

See the solution below.

Explanation

solution

```
root@node-1:~# k create deploy nginx-app --image=nginx:1.11.10-alpine --dry-run=client -o y
aml > app.yaml
root@node-1:~# vim app.yaml
root@node-1:~# k create -f app.yaml
deployment.apps/nginx-app created
root@node-1:~#
root@node-1:~#
root@node-1:~# k set image deploy nginx-app nginx=nginx:1.11.13-alpine --record
deployment.apps/nginx-app image updated
root@node-1:~# k rollout undo deploy nginx-app
deployment.apps/nginx-app rolled back
root@node-1:~#
```

NEW QUESTION: 58

Ensure a single instance of podnginxis running on each node of theKubernetes cluster wherenginxalso represents the Image name whichhas to be used. Do not override anytaints currently in place.

UseDaemonSetto complete thistask and useds-kusc00201asDaemonSet name.

Answer:

See the solution below.

List all service account and create a service account called "admin"

A. kubectl get sa

kubectl get sa --all-namespaces

kubectl create sa admin

//Verify

kubectl get sa admin -o yaml

B. kubectl get sa

kubectl get sa --all-namespaces

//Verify

kubectl get sa admin -o yaml

Answer: A ([LEAVE A REPLY](#))

NEW QUESTION: 60

Create a persistent volume with name app-data, of capacity 2Gi and access mode ReadWriteMany. The type of volume is hostPath and its location is /srv/app-data.

Answer:

See the solution below.

Explanation

solution

Persistent Volume

A persistent volume is a piece of storage in a Kubernetes cluster. PersistentVolumes are a cluster-level resource like nodes, which don't belong to any namespace. It is provisioned by the administrator and has a particular file size. This way, a developer deploying their app on Kubernetes need not know the underlying infrastructure.

When the developer needs a certain amount of persistent storage for their application, the system administrator configures the cluster so that they consume the PersistentVolume provisioned in an easy way.

Creating PersistentVolume

kind: PersistentVolume
apiVersion: v1
metadata:
 name: app-data
spec:
 capacity: # defines the capacity of PV we are creating
 storage: 2Gi
 # the amount of storage we are trying to claim
 accessModes: # defines the rights of the volume we are creating
 - ReadWriteMany
 hostPath:
 path:

"/srv/app-data" # path to which we are creating the volume

Challenge
* Create a Persistent Volume named ReadWriteMany, storage class name

shared, 2Gi of storage capacity and the host path

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: app-data
spec:
  capacity:
    storage: 2Gi
  accessModes:
    - ReadWriteMany
  hostPath:
    path: /srv/app-data
  storageClassName: shared

```

freeqas.com

"app-data.yaml" 12L, 194C

2. Save the file and create the persistent volume.

Image for post

```

njberryl91@cloudshell:~ (extreme-clone-265411)$ kubectl create -f pv.yaml
persistentvolume/pv created

```

3. View the persistent volume.

```

njberryl91@cloudshell:~ (extreme-clone-265411)$ kubectl get pv

```

NAME	CAPACITY	ACCESS MODES	RECLAIM POLICY	STATUS	CLAIM	STORAGECLASS	REASON	AGE
app-data	2Gi	RWX	Retain	Available		shared		31s

* Our persistent volume status is available meaning it is available and it has not been mounted yet. This status will change when we mount the persistentVolume to a persistentVolumeClaim.

PersistentVolumeClaim

In a real ecosystem, a system admin will create the PersistentVolume then a developer will create a PersistentVolumeClaim which will be referenced in a pod. A PersistentVolumeClaim is created by specifying the minimum size and the access mode they require from the persistentVolume.

Challenge

* Create a Persistent Volume Claim that requests the Persistent Volume we had created above. The claim should request 2Gi. Ensure that the Persistent Volume Claim has the same storageClassName as the persistentVolume you had previously created.

kind: PersistentVolumeapiVersion: v1metadata:name:

spec:

accessModes:-ReadWriteManyresources:

requests:storage:2Gi

storageClassName:shared

2. Save and create the pvc

njerry191@cloudshell:~(extreme-clone-2654111)\$ kubectl create -f app-data.yaml persistentvolumeclaim/app-data created

3. View the pvc

Image for post

```
njerry191@cloudshell:~ (extreme-clone-2654111)$ kubectl get pvc
NAME      STATUS    VOLUME   CAPACITY   ACCESS MODES   STORAGECLASS
pv        Bound     pv       512m       RWX            shared
```

4. Let's see what has changed in the pv we had initially created.

Image for post

```
njerry191@cloudshell:~ (extreme-clone-2654111)$ kubectl get pv
NAME      CAPACITY   ACCESS MODES   RECLAIM POLICY   STATUS   CLAIM          STORAGECLASS   REASON   AGE
pv        512m       RWX            Retain           Bound    default/pv     shared         16m
```

Our status has now changed from available to bound.

5. Create a new pod named myapp with image nginx that will be used to Mount the Persistent Volume Claim with the path /var/app/config.

Mounting a Claim

apiVersion: v1kind: Podmetadata:creationTimestamp: nullname: app-dataspec:volumes:-

name:congigpvcpersistenVolumeClaim:claimName: app-datacontainers:- image: nginxname:

appvolumeMounts:- mountPath: "

NEW QUESTION: 61

Create a configmap called cfgvolume with values var1=val1,
var2=val2 and create an nginx pod with volume nginx-volume which
reads data from this configmap cfgvolume and put it on the path
/etc/cfg

A. // first create a configmap cfgvolume

kubectl create cm cfgvolume --from-literal=var1=val1 --fromliteral=var2=val2

// verify the configmap

kubectl describe cm cfgvolume

// create the config map

kubectl create -f nginx-volume.yml

vim nginx-configmap-pod.yaml

apiVersion: v1

kind: Pod

- name: nginx-volume

configMap:

name: cfgvolume

containers:

- image: nginx

name: nginx

volumeMounts:

- name: nginx-volume

```
mountPath: /etc/cfg
restartPolicy: Always
k kubectl apply -f nginx-configmap-pod.yaml
/ // Verify
// exec into the pod
kubectl exec -it nginx -- /bin/sh
// check the path
cd /etc/cfg
B. // first create a configmap cfgvolume
kubectl create cm cfgvolume --from-literal=var1=val1 --fromliteral=var2=val2
// verify the configmap
kubectl describe cm cfgvolume
// create the config map
kubectl create -f nginx-volume.yml
vim nginx-configmap-pod.yaml
apiVersion: v1
kind: Pod
metadata:
labels:
run: nginx
name: nginx
spec:
volumes:
- name: nginx-volume
configMap:
name: cfgvolume
containers:
- image: nginx
name: nginx
volumeMounts:
- name: nginx-volume
mountPath: /etc/cfg
restartPolicy: Always
k kubectl apply -f nginx-configmap-pod.yaml
/ // Verify
// exec into the pod
kubectl exec -it nginx -- /bin/sh
// check the path
cd /etc/cfg
```

NEW QUESTION: 62

Score: 4%

Task

Scale the deployment presentation

Answer:

See the solution below.

Explanation

Solution:

```
kubectl get deployment
```

```
kubectl scale deployment.apps/presentation --replicas=6
```

NEW QUESTION: 63

Watch the job that runs 10 times one by one and verify 10 pods are created and delete those after it's completed

Answer:

```
kubectl get job -w kubectl get po kubectl delete job hello-job
```

NEW QUESTION: 64

Create a namespace called 'development' and a pod with image nginx called nginx on this namespace.

Answer:

```
kubectl create namespace development
```

```
kubectl run nginx --image=nginx --restart=Never -n development
```

NEW QUESTION: 65

Get list of all pods in all namespaces and write it to file "/opt/pods-list.yaml"

Answer:

See the solution below.

Explanation

```
kubectl get po -all-namespaces > /opt/pods-list.yaml
```

NEW QUESTION: 66

A Kubernetes worker node, named wk8s-node-0 is in state NotReady. Investigate why this is the case, and perform any appropriate steps to bring the node to a Ready state, ensuring that any changes are made permanent.

You can ssh to the failed node using:

```
[student@node-1] $ | ssh Wk8s-node-0
```

You can assume elevated privileges on the node with the following command:

```
[student@w8ks-node-0] $ | sudo -i
```

Answer:

solution

The screenshot shows a web terminal window titled "Web Terminal" with "THE LINUX FOUNDATION" logo. The terminal output shows the following commands and results:

```
root@node-1:~# kubectl config use-context wk8s
Switched to context "wk8s".
root@node-1:~# k get nodes
```

NAME	STATUS	ROLES	AGE	VERSION
wk8s-master-0	Ready	master	77d	v1.18.2
wk8s-node-0	NotReady	<none>	77d	v1.18.2
wk8s-node-1	Ready	<none>	77d	v1.18.2

```
root@node-1:~# ssh wk8s-node-0
█
```

A large diagonal watermark "freeqas.com" is visible across the terminal output. The terminal also features a "Readme" button and a scrollbar on the right side.

```
wk8s-node-0    NotReady    <none>    77d    v1.18.2
wk8s-node-1    Ready       <none>    77d    v1.18.2
root@node-1:~# ssh wk8s-node-0
Welcome to Ubuntu 16.04.6 LTS (GNU/Linux 4.4.0-1109-aws x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

 * Are you ready for Kubernetes 1.19? It's nearly here! Try RC3 with
   sudo snap install microk8s --channel=1.19/candidate --classic
   https://microk8s.io/ has docs and details.

4 packages can be updated.
1 update is a security update.

New release '18.04.5 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

student@wk8s-node-0:~$ sudo -i
root@wk8s-node-0:~# systemctl restart kubelet
root@wk8s-node-0:~# systemctl enable kubelet
```

NEW QUESTION: 67

Create a pod with environment variables as var1=value1. Check the environment variable in pod

A. `kubectrl run nginx --image=nginx --restart=Never --env=var1=value1`

then

`kubectrl exec -it nginx -- env`

or

`kubectrl exec -it nginx -- sh -c 'echo $var1'`

or

`kubectrl describe po nginx | grep value1`

B. `kubectrl run nginx --image=nginx --restart=Never --env=var1=value1`

then

`kubectrl exec -it nginx -- env`

or

`kubectrl describe po nginx | grep value1`

Answer: ([SHOW ANSWER](#))

NEW QUESTION: 68

Modify "hello-job" and make it run 10 times one after one and 5 times parallelism: 5

A. `kubectl create job hello-job --image=busybox --dry-run -o yaml`

`-- echo "Hello I am from job" > hello-job.yaml`

// edit the yaml file to add completions: 16 and

`kubectl create -f hello-job.yaml`

YAML File:

`apiVersion: batch/v1`

`kind: Job`

`metadata:`

`name: hello-job`

`spec:`

`completions: 16`

`parallelism: 5`

`template:`

`metadata:`

`spec:`

`containers:`

`- command:`

`- echo`

`- Hello I am from job`

`image: busybox`

`name: hello-job`

`restartPolicy: Never`

B. `kubectl create job hello-job --image=busybox --dry-run -o yaml`

`-- echo "Hello I am from job" > hello-job.yaml`

// edit the yaml file to add completions: 10 and

`kubectl create -f hello-job.yaml`

YAML File:

`apiVersion: batch/v1`

`kind: Job`

`metadata:`

`name: hello-job`

`spec:`

`completions: 10`

`parallelism: 5`

`template:`

`metadata:`

`spec:`

`containers:`

- command:
- echo
- Hello I am from job

image: busybox

name: hello-job

restartPolicy: Never
